

## Brief information about the project

Name of the project	AP09260767 "Development of an intelligent information and analytical system for assessing the health status of students in Kazakhstan" (0223RK00642)
Relevance	The implementation of the tasks of this project will make it possible to develop an up-to-date, but currently missing, system that collects and analyzes information on the health status of students on a regular and continuous basis, which is of great importance from the point of view of sustainable national development.
Purpose	Development and implementation of an information and analytical system for assessing the health of students to form a set of measures to prevent diseases and improve the quality of life of young people using artificial intelligence algorithms.
Objectives	<ol style="list-style-type: none"><li>1. Development of the architecture of an intelligent information and analytical system for assessing the health status of students.</li><li>2. Research of health indicators and indicators related to the health of students based on a survey and a medical examination.</li><li>3. Development of a module for the collection, storage and preprocessing of data on health indicators and indicators related to the health of students obtained as a result of surveys and medical examinations.</li><li>4. Design and development of a student's digital health profile as a module of the educational process automation system using cloud technologies.</li><li>5. Development of machine learning algorithms for multifactorial analysis of a complex of health indicators and indicators related to the health of students and identification of the influence of biological, social, psychological, geochemical factors on the health and quality of life of students.</li><li>6. Design and development of a student's digital health passport based on the processing and consolidated analysis and classification of data, taking into account the threshold values of health indicators and health-related indicators.</li><li>7. Development of recommendation functionality for the prevention and rehabilitation of students.</li></ol>
Expected and achieved results	<ul style="list-style-type: none"><li>– The architecture of an intelligent information and analytical system for assessing the health status of students has been developed;</li><li>– Health indicators and indicators related to the health of students based on a survey and a medical examination are investigated;</li><li>– A module has been developed for the collection, storage and preprocessing of data on health indicators and</li></ul>

	<p>indicators related to the health of students obtained as a result of surveys and medical examinations;</p> <ul style="list-style-type: none"> <li>– A student's digital health passport has been designed and developed based on the processing and consolidated analysis and classification of data, taking into account the threshold values of health indicators and health-related indicators;</li> <li>– A recommendation functionality for the prevention and rehabilitation of students has been developed;</li> </ul>
